AP CSP Unit 6 Day 3 Assessment

1. (DOK 1) What is the primary purpose of data cleansing?

   A. To create charts

   B. To improve data quality by correcting errors

   C. To distribute surveys

   D. To write code

2. (DOK 1) Which Excel feature can automatically detect patterns and fill data?

   A. PivotTable

   B. Flash Fill

   C. Solver

   D. Macros

3. (DOK 1) Which chart is most appropriate for comparing quantities across categories?

   A. Bar chart

   B. Scatter plot

   C. Histogram

   D. Map

4. (DOK 1) What should be done before distributing a survey broadly?

   A. Delete responses

   B. Test the survey

   C. Create recommendations

   D. Publish results

5. (DOK 2) Why might a researcher remove duplicate responses from a dataset?

   A. To increase bias

   B. To improve accuracy of analysis

   C. To reduce sample size

D. To make charts colorful

6. (DOK 2) A dataset contains names entered as "Smith, John" and "John Smith." What process should occur before analysis?

A. Data cleaning and standardization

B. Data deletion

C. Survey redistribution

D. Visualization

7. (DOK 2) Why is selecting the appropriate chart type important?

A. It helps communicate patterns accurately

B. It changes the data values

C. It increases sample size

D. It guarantees causation

8. (DOK 3) A team uses a pie chart with 20 categories. What is the best evaluation?

A. The chart is effective because it includes all data

B. The chart may be difficult to interpret and another visualization may work better

C. The chart proves causation

D. The chart eliminates bias

9. (DOK 3) After cleaning survey data, a trend disappears. What is the most reasonable conclusion?

A. The original trend may have resulted from flawed data

B. The data should not be cleaned

C. The survey must be discarded

D. The trend is still valid

10. (DOK 4) A school collects student survey data, finds inconsistent responses, uses Flash Fill to standardize entries, creates visualizations, and presents recommendations. Which statement best describes this work?

A. Only data collection was completed

B. The team followed multiple stages of the data science process to make data-driven recommendations

C. The team only performed visualization

D. The team proved cause-and-effect relationships
